Subject: RDI Applications for Lands Underlying Kantishna River, Birch Creek, Muddy River, Lake Minchumina, Deep Creek, and Jim Lake in the Tanana River Subregion

On September 20, 2005, the State of Alaska filed applications with the Bureau of Land Management (BLM) for recordable disclaimers of interest (RDI) for the beds of the Kantishna River, Birch Creek (a portion thereof), Muddy River, Lake Minchumina, Deep Creek, and Jim Lake in the Tanana River subregion.¹ Kantishna River, Birch Creek, and Muddy River comprise a well known route of travel by boat to Lake Minchumina. Deep Creek and Jim Lake are small water bodies in the vicinity of Lake Minchumina. The purpose of this paper is to review the merits of the State's RDI applications. The paper summarizes, for each water body, the status of adjacent uplands, the history of BLM navigability determinations, and, where appropriate, the evidence of commercial navigation.

The State of Alaska asserts that it is the owner of the lands underlying the subject water bodies under title navigability law and riparian law. If the water bodies were navigable in fact and in law, then title to the lands underlying the water bodies passed to the State at the time of statehood (1959). If a water body is not navigable, and the State is the riparian landowner, then the State claims ownership of the submerged lands under riparian law. In support of its assertion, the State cites as authorities the Equal Footing Doctrine, the Submerged Lands Act of 1953, the Alaska Statehood Act, the Submerged Lands Act of 1988, and "any other legally cognizable reason."

¹ See Dick Mylius to Henri Bisson, September 20, 2005, file FF-094612 (1864), submitting the applications as a group. For specific applications, see Dick Mylius to Henri Bisson, BLM, September 21, 2005 for Kantishna River and a segment of Birch Creek in file FF-094612 (1864), Alaska State Office, BLM records, Anchorage. Identical letters were sent for Deep Creek (FF-094609), Jim Lake (FF-094608), Muddy River (FF-094610), and Lake Minchumina (FF-094611).

DRAFT

In support of its applications, the State submitted numerous BLM memoranda and historical reports containing evidence relating to the navigability of the subject water bodies. The information in these memoranda has been incorporated into this memo where appropriate. For a complete list of the submitted documents by application, see Attachment A.

Kantishna River-Lake Minchumina System

Located in the Tanana River subregion, in Interior Alaska, the Kantishna River-Lake Minchumina system, approximately 225 miles in length, is a historic route of travel and transportation. The system consists of four water bodies (in downstream order): Lake Minchumina, Muddy River, Birch Creek, and Kantishna River. All of the water bodies are ice-free for approximately six months. The system is approximately 200 miles southwest of Fairbanks.

The Kantishna River is a major tributary of the Tanana River. From its head at the confluence of Birch Creek and McKinley River, the Kantishna River meanders northeasterly approximately 175 miles to empty into the Tanana River approximately 69 miles below the town of Nenana, a river port on the Alaska Railroad or approximately 99 miles from the Yukon River.² For most of its length, the river is well over 200 feet wide, has a moderate current, and contains many islands in its channel. Although many clearwater streams and lakes (e.g., Bearpaw River, Lake Minchumina) contribute to its flow, the Kantishna River is a muddy stream. Several large rivers, such as the McKinley River, head in glaciers and discharge silty waters into the upper reaches of the river.³ In addition to McKinley River and Birch Creek, the river's principal tributaries are, in upstream order, the Toklat River (rivermile 62.4) and Bearpaw River (rivermile 118.5).

At a pre-application meeting on April 1, 2005, the National Park Service reported that over a period of perhaps fifty years the upper Kantishna River has cut a new main channel. On the USGS maps, based on aerial photographs taken in the early 1950's, the nine-mile-long reach in question extends from a point several miles below the confluence of McKinley River and Birch Creek to a point in Section 31, T. 11 S., R. 19 W., Fairbanks Meridian (FM), Alaska. On an August 1979 aerial photograph, it is evident that a minor channel leaves the river below the Chilchukabena Lake, flows northeasterly to the lake in Secs. 25 and 36, T. 11 S., R. 20 W., FM, and then swings southeasterly to return to the main channel. The USGS maps show only disconnected creeks in this area. By 2000, this channel had become the main channel of the Kantishna River. The former main channel had become a minor channel.⁴

The Kantishna River and Lake Minchumina are linked by a 50-mile-long system of waterways called Muddy River and Birch Creek. From the eastern end of the lake, the Muddy River⁵ flows approximately forty-eight miles northeasterly and then southerly through a lake-studded lowland

⁴ See USGS map and copies of two aerial photos in casefile FF-094610 (1864), BLM records. The August 1979 photo is a NASA color infra-red photo taken in August 1979. The second photo is a mosaic of Landsat 7 imagery from August 28, 1999 and August 16, 2000.

⁵ See USGS Skagway B-3 and B-4 Quadrangles.

to Birch Creek, which in turn flows approximately two miles to the Kantishna River.⁶ Both rivers are narrow, muddy, deep, and flow with little current. According to one report, the Muddy River is so crooked that in some places only ten feet of land separates the channels.⁷

Lake Minchumina (elevation 642 feet) is located approximately 200 miles southwesterly of Fairbanks, the largest city in Interior Alaska, and 65 miles north-northwest of Mt. McKinley. The lake also has the distinction of being about five miles northwest of Alaska's geographic center.⁸ At its maximum, the irregularly-shaped lake is about nine miles long and five miles wide for a total area of approximately 16,000 acres. The known maximum depth is thirty-nine feet.⁹

The lake's water levels have declined over the years. Researchers cite earthquakes, insufficient snowfall, and the Foraker River as possible causes. In a study of subsistence activities in the area, one former local resident reported that since the 1940's water levels had generally declined, reaching a low point in 1976. Water levels were two to four feet lower. In the fall of that year, "most of the western portion of the lake was dry" and the remainder was "very shallow." The record-breaking earthquake of 1964 may have caused the water table to drop. The build-up of silt from the Foraker River at the lake's outlet may be the cause. As he explained it, "siltation has raised the lake bottom, which has increased the gradient at the outlet and resulted in increased scouring and deepening of the channel. This in turn allowed the water level to drop." He noted, however, that this explanation did not account for the fact that water levels in the Muddy River was also lower. Where before many sloughs and ponds had permanent water connections with the Muddy River, now they were connected at high water stages only.¹⁰

By 2006, water levels had declined to such an extent that boats could not be used on perhaps a third of the lake. Researchers also attributed this fact to the meanderings of the Foraker River and to earthquakes. Since before the 1960's, the Foraker River's mouth has moved from the head of Muddy River to the easternmost part of the lake "several times." From 1992 to 2001, for example, the Foraker discharged large quantities of glacial silt into the lake. In 2001, the Foraker shifted back and stopped dumping as much silt into the lake. According to local residents, after the 1964 earthquake, water levels in the lake dropped eight feet. Following an earthquake in October 2002, water levels dropped two feet.¹¹

⁶ There is a difference of opinion as to whether this section is in fact Birch Creek or Muddy River. Local Natives reportedly refer to this lowermost reach as part of Muddy River rather than Birch Creek. See Gudgel-Holmes 1991, 92.

⁷ Warren "Slats" Lindsay to Mr. and Mrs. Holmes, July 4, 1982, Kantishna Oral History Project, Dianne Gudgel-Holmes, Records, 1910-84, Archives and Special Collections, University of Alaska, Anchorage (hereafter UAA Archives). Lindsay's claim that the river was about 30 feet deep probably is an exaggeration. See "Transcript of Interview Conducted 1/14/84 by Clifford Cernick with Warren ("Slats") Lindsay 'Last of the FAA Riverboaters; at Lincoln City, Oregon, in same collection. The writer thanks Steve Taylor of the Alaska Department of Natural Resources, Anchorage, for bringing these records to my attention.

Land Status and BLM Navigability Determinations¹²

Land ownership is mixed. At the time of statehood, the lands were not in a reserve or withdrawal. Today, the BLM and the National Park Service are the principal federal riparian landowners. Muddy River, Birch Creek, and Upper Kantishna River are located within the Denali National Preserve, created by the Alaska National Interest Lands Conservation Act of 1980. BLM lands are primarily located along the Kantishna River and Lake Minchumina. Doyon, Ltd., a regional Native corporation, has selected most of these lands along the Kantishna River. Although it has taken title to certain lands along Muddy River, the regional corporation has not yet been conveyed lands along the Kantishna River. A Native group has also selected BLM-managed lands at Lake Minchumina. Finally, the State of Alaska owns much land abutting the Kantishna River, most of it conveyed in the late 1970's and early 1980's under the Alaska Statehood Act. In the early 1960s, the State also received title to most land along Lake Minchumina under the Mental Health Act of 1956.

Kantishna River

The Kantishna River flows through twenty townships. The United States is the principal riparian landowner. The National Park Service and the BLM are the land managers. In the uppermost four townships (Tps. 11 S., Rs. 18 and 19 W., FM, and Tps. 12 S., Rs. 19 and 20 W., FM), the river is located within the Denali National Preserve. The BLM manages lands in nine townships (and two partial townships), specifically, in Tps. 5 and 6 S., R. 14 W., FM; T. 7 S., R. 15 W., FM; Secs. 5-8, 17, and 18, T. 8 S., R. 15 W., FM; Tps. 8 and 9 S., R. 16 W., FM; T. 9 S., R. 17 W., FM; Secs. 9 and 16-18, T. 10 S., R. 17 W., FM; and T. 10 S., R. 18 W., FM.

Both Doyon, Ltd., and the State of Alaska have filed selections on the BLM-managed lands. Although the BLM has issued memos determining the Kantishna River to be navigable in these selection areas, it has not yet issued legal decisions to convey lands on the basis of these navigability determinations.

Doyon, Ltd., land selections are scattered along the river. The regional corporation selected lands in the north half of T. 10 S., R. 18 W., FM (F-21903-72) and in the south half of T. 10 S., R. 18 W., FM (F-21609-70); in Secs. 9, 16-18, T. 10 S., R. 17 W., FM (F-21903-71); T. 9 S., R. 17 W., FM (F-21906-66); T. 9 S., R. 16 W., FM (F-21903-65); T. 8 S., R. 16 W., FM (F-21903-63); Secs. 5-8, 17, and 18, T. 8 S., R. 15 W., FM (F-21903-63); T. 7 S., R. 15 W., FM (F-21903-61); T. 6 S., R. 14 W., FM (F-21903-60); and T. 5 S., R. 14 W., FM (F-21903-59).

The State of Alaska has filed selections for lands along the river in the following townships: T. 10 S., R. 18 W., FM (F-44040); T. 9 S., R. 17 W., FM (F-44031); T. 9 S., R. 16 W., FM (F-44030); T. 8 S., R. 16 W., FM, (F-44021); Secs. 5-8, 17, and 18, T. 8 S., R. 15 W., FM (F-44020); T. 7 S., R. 15 W., FM (F-44011); Secs. 28, 32, and 33, T. 6 S., R. 15 W., FM (F-43999); T. 6 S., R. 14 W., FM (F-43998); and T. 5 S., R. 14 W., FM (F-43985).

The BLM's land records show that the State of Alaska is the principal non-federal riparian landowner. The State owns all riparian lands in seven townships and in two partial townships.

¹² Land status analyses are based solely on BLM's current master title plats.

The seven townships are: Tps. 2 and 3 S., R. 12 W., FM; Tps. 3-5 S., R. 13 W., FM; T. 6 S., R. 15 W., FM; and T. 10 S., R. 16 W., FM. The two partial townships where the riparian lands have been conveyed to the State are: Secs. 19 and 30, T. 8 S., R. 15 W., FM; and Secs. 1, 2, 10-12, 14, 15, 19-21, 29, and 30, T. 10 S., R. 17 W., FM. Prior to conveying these lands to the State, the BLM consistently held that the Kantishna River was navigable. These determinations were incorporated into the decisions to convey the uplands.¹³

Less than a half dozen Native allotments are located along the Kantishna River. Nearly all are surveyed. In these cases, the river was meandered and the uplands segregated from the riverbed. One Native has applied for lands abutting the lower reaches of the river.

Birch Creek

The State of Alaska has applied for the Birch Creek from its mouth at Kantishna River to the mouth of Muddy River, a distance of approximately two miles. This reach, located in T. 12 S., Rs. 20 and 21 W., FM, is entirely within the Denali National Preserve. The National Park Service manages the riparian lands. The United States has not yet determined the navigability of Birch Creek.

Muddy River

Muddy River lies in six townships: Tps. 10-12 S., R. 21 W., FM; T. 11 S., R. 22 W., FM; and Tps. 11 and 12 S., R. 23 W., FM. Nearly all of the river is located within the Denali National Preserve. The National Park Service is the principal riparian landowner in all but one township (i.e., T. 10 S., R. 21 W., FM). In addition, a Native Group has selected lands along the river in Sections 25, 26, 34, and 35, T. 11 S., R. 23 W., FM (AA-11184). Where the United States is the riparian landowner, the navigability of Muddy River has not yet been determined.

The State of Alaska owns riparian lands in Sec. 33, T. 11 S., R. 23 W., FM, and in Secs. 4, 5, and 8, T. 12 S., R. 23 W., FM. The lands are located along the uppermost reaches of the river where it leaves Lake Minchumina. In 1963, under the Mental Health Act of 1956, the BLM granted tentative approval for the conveyance of these lands. The decision to convey the lands stated, "Acreage approved includes both land and water areas as shown on the protracted township diagram. When the official plat of survey is filed patent will issue excluding navigable water acreage." In 1982, the BLM determined that all of Muddy River in Tps. 11 and 12 S., R. 23 W., FM, was navigable.¹⁴ The lands have not yet been surveyed and patented.

Doyon, Ltd., owns riparian lands in Secs. 31-33, T. 10 S., R. 21 W., FM. On July 30, 2002, the BLM issued Interim Conveyance No. 1847. The Interim Conveyance document stated that lands underlying rivers or streams three chains wide or wider "and navigable waters, if any," were

¹³ Some BLM memos refer to a February 17, 1976 memo determining that the Kantishna River is navigable from its mouth to Roosevelt. The writer did not find a copy of the 1976 memo.

¹⁴ Robert F. Hilton, Decision, September 11, 1963; C. M. Wheeler, "Mt. McKinley #1, FY83," December 13, 1982; and Robert D. Arnold to Chief, Division of ANCSA and State Conveyances, December 28, 1982, file F-028722, state selection files, BLM, Alaska State Office (hereafter BLM records).

excluded from the conveyance and that these lands would be identified at the time of survey.¹⁵ The BLM has not yet determined the navigability of this reach of the Muddy River; it also has not yet surveyed the lands. Given these facts, this memo addresses the navigability of this reach.

The BLM has also issued certificates to several Native allotments along Muddy River. In all cases, the Muddy River was meandered and the submerged lands segregated from the uplands.

Lake Minchumina

Lake Minchumina is located in four townships: Tps. 12 S., Rs. 23-25 W., FM, and T. 11 S., R. 24 W., FM. The State of Alaska is the principal riparian landowner. In 1963 the BLM granted tentative approval to conveyance of the lands under the Mental Health Act of 1956 under F-028722. The decision document stated that navigable waters would be identified at the time of survey. In 1982 the BLM determined that the lake was navigable.¹⁶

Numerous patented parcels of land and Air Navigation Site No. 190 (U.S. Survey No. 2655) were excluded from the State conveyance. Several Native Allotment applications and a Native Group selection of lands along the lake are also on record. The Native allotment applications are located in T. 12 S., R. 23 W., FM (F-1282-B; U.S. Survey No. 8096) and in T. 12 S., R. 24 W., FM (F-1282-A). In all these cases, lands underlying Lake Minchumina were excluded.

Evidence of Commerce: Tanana River to Roosevelt Reach

Located only fourteen miles from the navigable waters of the Kuskokwim River, the Kantishna-Lake Minchumina system was an important inter-regional route of travel between the Tanana River and the Kuskokwim River. During the gold rush era, the system was also an important route of travel and transportation to placer and hard rock mines in the area around the headwaters of the Kantishna River. With the arrival of the aviation age, the system as an inter-regional route of travel fell into disuse. The construction of winter tractor roads and a summer truck road from the Alaska Railroad to the mining district in the 1930's, also resulted in a decline in traffic. During the 1940's and early 1950's, the barge operations of the Civil Aeronautics Administration (CAA) and later, the Federal Aviation Agency (FAA), to Lake Minchumina was practically the only commercial operation on the system, but this too came to an end when the agency substituted airplanes for barges.

The Kantishna River's history as a highway of commerce is well known. During the Kantishna gold rush of 1905, commercial freighters discovered that the Kantishna River was usually navigable for steamboats and gas-powered boats to Bearpaw River and Roosevelt. Oftentimes, freighters ascended the Bearpaw River to its head of navigation, where Diamond City was founded. Alternatively, those freighters' boats carrying heavier cargoes continued up the

¹⁵ Barbara Opp Waldal, Decision, January 18, 2002, and Interim Conveyance No. 1847, July 30, 2002, file F-21904-91, ANCSA files, BLM-ASO. Unlike the Interim Conveyance document, the decision document did not contain a statement providing for the exclusion of lands underlying navigable waters.

¹⁶ Robert F. Hilton, Decision, September 11, 1963; C. M. Wheeler, "Mt. McKinley #1, FY83," December 13, 1982, and Robert D. Arnold to Chief, Division of ANCSA and State Conveyances, December 28, 1982, file F-028722, state selection files, BLM records.

Kantishna River to a place called Roosevelt, approximately 42 miles above the mouth of the Bearpaw River. From this point, miners transported supplies and equipment over summer and winter trails that extended to the gold placer and hard rock mines in the vicinity of Moose Creek, a tributary of Bearpaw River.

This pattern of travel and transportation continued well into the 1930's. During the late 1910's and early 1920's, when the Kantishna district experienced a mining boom, Roosevelt became an important trans-shipment point. Large amounts of mail, supplies, and mining equipment were landed at Roosevelt for shipment to Kantishna. The Alaska Road Commission (ARC), the federal agency then responsible for most road and trail construction in Alaska, improved a winter road from Roosevelt to Kantishna. During the winter months, miners had large tonnages of ore transported by horse to Roosevelt for shipment by barge down the Kantishna, Tanana, and Yukon Rivers to St. Michael and thence by ship to a smelter in Tacoma, Washington.

In later years, the Kantishna River to Roosevelt declined in importance as a route for transportation of supplies and equipment to the Kantishna district. Beginning in the 1920's, miners relied increasingly upon airplanes as a means to travel and transport small quantities of freight. In addition, miners and the federal and territorial governments constructed winter roads from the Alaska Railroad to the district for use in transporting heavy mining equipment to the mines and ore from the mines to market. The McKinley Park road, completed in 1936, virtually eliminated the Kantishna River as a summer route of travel and transportation. The construction of the Lignite-Stampede-Kantishna road, completed in 1939, provided winter access to the Alaska Railroad.

Today, there are no large communities located along the system. Roosevelt has long been abandoned and, since the river has changed course, the place is no longer located along the river.¹⁷ According to the 2000 census, Lake Minchumina, the only community along the system, had a population of thirty-two. A few Native allotments scattered along the system are seasonally occupied. These account for most habitations along the system.

Kantishna Gold Rush of 1905

In 1919 Stephen R. Capps of the U.S. Geological Survey recounted the history of the Kantishna gold rush of 1905 as follows:

The discovery of gold in the Kantishna district was an indirect result of the Fairbanks rush. In 1904 Joe Dalton and his partner, Reagan, prospected in the basin of Toklat River, and after having found gold in encouraging amounts returned to Fairbanks that fall. The next spring Dalton and another partner, Stiles, returned to the Toklat and prospected on Crooked Creek, a tributary heading in the Kantishna Hills 16 miles south of Mount Chitsia. In the summer of 1905 two other prospectors, Joe Quigley and his partner, Jack Horn, had been told by some trappers that there was gold in Glacier Creek, and they came in to investigate. They found gold in paying quantities, staked the creek, and in June of the year carried the news of their discovery to Fairbanks and so started the stampede to Kantishna. The stamperders began to arrive at the scene of the discovery about July 15, 1905. Meanwhile Dalton and Stiles, having heard nothing of the Quigley-Horn discovery, had traveled along the southeast side of the Kantishna Hills and arrived at Friday

¹⁷ In 1974 Val Blackburn of Minchumina reported that the former town was no longer on the river because the river had changed its course. *Fairbanks Daily News-Miner*, August 13, 1974, 15. For a discussion of the change in river course in this area, see page 3.

Creek. Prospecting there they found gold, and on July 12 they staked that stream. On July 20 they staked Discovery claim on Eureka Creek, but thinking themselves entirely alone in the country they staked only that claim, having determined to prospect first the upper part of the stream. They went up Eureka Creek, and on their way back to the mouth of that stream they met a man named Cook, who had come in with the rush and had made his way up Moose Creek to the mouth of Eureka Creek. Cook said he had staked claims No. 1 to No. 4 on the Eureka, so Dalton and Stiles returned and staked the rest of the creek above claim No. 4.

Late in the summer and in the fall of 1905 the Kantishna district was the scene of great excitement. Several thousand people then arrived, most of them coming by boat up Kantishna River and its tributaries, Bearpaw and McKinley rivers during the season of open water, and by dog and sled later in the fall after snow had fallen. Practically every creek that heads in the Kantishna Hills was staked from source to mouth, and the benches and intervening ridges were not ignored. Within a few weeks a number of towns were built, the largest of which were Glacier, on Bearpaw River at the mouth of Glacier Creek; Diamond, at the mouth of Moose Creek; and Roosevelt and Square Deal on Kantishna River. At each of these places log cabins, stores, hotels, and saloons were erected, and between them and the creeks a constant stream of gold seekers traveled back and forth. By midwinter, however, it became generally known that rich, shallow diggings, the eternal hope of the prospector, were restricted to a few short creeks, and an exodus began. The richest ground was mined vigorously during the summer of 1906, but by fall the population had dwindled to about 50, those who remained being the few who had staked paying claims or who were convinced that thorough prospecting held out sufficient promise of new discoveries.

In the winter of 1906 Roosevelt, Square Deal, and Diamond were almost completely deserted. Glacier, being nearest to the creeks, is still used as winter quarters by a number of miners who prefer to spend the cold months in the shelter of the timber, near their fuel supply, rather than to haul wood to their summer camps.¹⁸

Capps did not indicate his sources for this account, but it is most likely that he relied heavily upon the memories of local miners, many of whom participated in the stampede and were lucky enough to find paying ground. The account appears to be correct in its essentials, although his estimate of the number of participants may be too high. Charles Sheldon, who visited the area in the late 1900's and was an important figure in the creation of the Mt. McKinley National Park, estimated 400 to 500 participants. The local newspaper reports usually cited hundreds (not thousands) of people in the Kantishna district. In August 1905, for example, the vice-president of the Northern Commercial Company, the principal mercantile company in Alaska, estimated that there were 300 miners in the district. By September, it was reported in Fairbanks that more than 400 people were in the district. By mid October, according to two prominent Kantishna miners, "fully one thousand people" were in the district. In mid November, a Kantishna miner gave an estimate of 1,200 to 1,500 people in the new district.¹⁹ Although men continued to stampede into the district during the winter, it is likely that their numbers were not great. Certainly, by February 1906, the tide had turned. After discovering that the district was not suitable for winter mining, people began leaving for Fairbanks and other parts of Alaska.

As Capps stated, most people relied upon boats to reach the new diggings. In the initial stages of the stampede, miners hoped to reach the new diggings before all the creeks were claimed, and so took it upon themselves to pole boats (a laborious and time-consuming task) up the Kantishna

¹⁸ Capps 1919, 75-76.

¹⁹ *Yukon World*, August 30, 1905, 4, September 29, 1905, 3; and October 14, 1905, 1; *Dawson Daily News*, December 22, 1905, 1. The writer thanks National Park Service historian Logan Hovis for providing many local newspaper articles relating to the Kantishna gold rush period of 1905-06.

River and the Bearpaw River to various points before disembarking and traveling overland to the creeks. In mid July 1905 a prospector returning to Fairbanks counted some sixty outfits in poling boats ascending the Kantishna River for the Bearpaw River.²⁰

Local commercial boat operators on the Lower Tanana River quickly stepped in to meet demands for transportation to the Upper Kantishna. During the months of August and September, 1905, the steamer *White Seal* made at least three round-trips from Fairbanks to the Upper Kantishna. On one of its first trips, the steamer reportedly delivered nineteen passengers and more than twenty tons of freight to the Bearpaw River.²¹ In late September, Captain G. P. Sproul of the *White Seal* reported a successful voyage to Roosevelt City, a new town located on the Kantishna River above the mouth of Bearpaw River, where up to twenty-eight passengers and freight, including a sawmill, were landed. He planned to make another trip up the Kantishna “as soon as orders can be filled” and if water levels were high enough.²²

Other commercial boats that ascended the Kantishna River to Bearpaw River in 1905 included: the *Jennie M.*, the *Tanana Chief*, the *Dusty Diamond*, the *Tana*, the *Florence S.*, the *Luella*, the *Pup*, the *Zodiac*, and the *Martha Clow*.²³ On August 30 an unidentified steamer left Fairbanks bound for the upper Kantishna, carrying “forty passengers, several outfits for stores, a saloon and restaurant.”²⁴ In late September, the steamer *Dusty Diamond* landed passengers and fifty tons of goods at the mouth of Moose Creek, a tributary of the Bearpaw River. The place, called Diamond, was frequently identified as the head of navigation on the Bearpaw River for small boats.²⁵

By August 30, 1905, four townsites were located along the upper Kantishna River: Morgan City, Roosevelt City, McKinley City, and Bearpaw City. The farthest one upriver was Morgan City, located at the mouth of McKinley River. According to one local newspaper, Morgan City was “not so anxious to supply the [Kantishna] mines as it is to be the gateway of a new country to be opened along the McKinley and its forks, and the trade will go up the Kantishna to the Kuskokwim [Kuskokwim] and its tributaries.” Bearpaw City was located at the mouth of Bearpaw River. Some miners disembarked steamboats here and proceeded up Bearpaw River in small poling boats. They planned to return with horses in the winter to move seventy-five tons of freight from Bearpaw City to the mines.²⁶

Late in the summer of 1905, freighters debated whether McKinley City or Roosevelt City would become the entrepot for the Kantishna Mining District. Roosevelt City was located

approximately ten miles below the mouth of McKinley River; McKinley City, approximately twenty miles below the mouth of McKinley River.²⁷ McKinley City was founded by a party that included Gordon Bettles, who founded the town of Bettles, the head of steamboat navigation on the Koyukuk River, during the Klondike Gold Rush. The party chartered the steamer *Luella*, at \$40 a day, with the intent to locate a townsite at the head of navigation for large steamboats on the Kantishna River.²⁸ After examining a number of routes from the mines to navigable water, the Bettles party chose the site of McKinley City and started to build cabins. Critics pointed out that the place was in a swampy area with little timber, and the trail to the diggings was located on wet ground.

Roosevelt City was located on well-timbered, higher ground, and the trail to the mines was shorter and drier.²⁹ According to passengers on the steamer *White Seal*, Roosevelt was founded by two men named George Noble and William Hunter. George Noble was a member of the *Luella* party. Upon learning that William Hunter had built a cabin twelve miles above McKinley City and was able to reach the diggings over a dry trail in eight hours, he spread the news, thereby causing a stampede from McKinley City to what became the site of Roosevelt. Less than a half dozen people were left at McKinley City.³⁰

For a short while, there was reason to believe that McKinley City might survive as a townsite. According to one report, only smaller boats could be taken to Roosevelt. The larger boats could not pass over a two-hundred-yard-long bar in the Kantishna between McKinley and Roosevelt, even at a good stage of water. Above that section, the river was narrow and swift. The steamer *White Seal* succeeded with “considerable trouble” in reaching Roosevelt when the water level was above normal. The captain found only two feet of water on the bar. Boosters of Roosevelt, however, believed that once water levels subsided, the river would cut a new channel through that section, making it possible for the larger boats to navigate that section.³¹

Certainly by early September the question was decided when Lee Van Slyke, the U.S. Commissioner of the Kantishna Mining District, decided upon Roosevelt as his headquarters.³² On September 10, 1905, R. T. Engelbrecht, a trader, recounted Roosevelt City’s advantages over McKinley City: “Now, regarding the building site of the city of Roosevelt, I can only say that it is the ideal place for a permanent town—high ground; dry, plenty of moss and timber, flat and level, good water for drinking, and plenty of water for a boat drawing thirty inches of water at all times during the season. The trail to the mines is not more than twelve miles, and is high and dry; in fact, on the last seven miles it is hard to get any water. There is plenty of timber for any small bridges, in case they are needed. Two men went over and had dry feet and clothes during the trip, and found it easy walking, and made the trip in five hours.” When Engelbrecht wrote

²⁷ Capps 1919, 18. According to a Fairbanks report in mid October, Roosevelt city was “twenty miles below the mouth of McKinley river and 12[?] miles above where McKinley City was started.” *Yukon World*, October 14, 1905, 1.

his letter, the town consisted of about twenty cabins.³³ Several weeks later, one stamperder wrote a letter to Fairbanks upon his arrival at Roosevelt City: “We arrived here last night and find the place booming. Everyone is rustling moss and logs for building purposes. Each one who has a town lot thinks he has a fortune in sight. The system of laying out the city is very good. The streets are well proportioned, with alleys to the rear, and the townsite is located on good high ground.”³⁴

As a gold rush town, Roosevelt City survived only a few months. In its heyday, the place had population of 150, two stores (operated by Kreier & Teterman and Englebrecht & Co.), and a sawmill. Plans were even underway to install an electric light plant.³⁵ By spring the spring of 1906, however, the place was almost abandoned. Some miners moved from Roosevelt to camps (i.e., Diamond and Glacier) nearer the diggings. Upon finding that much of the ground in the Kantishna District had already been claimed and that the district was not suitable for winter mining, many people left the district. When the U.S. Commissioner moved his headquarters to Glacier City, on the upper Bearpaw River, so that miners did not have to travel as far to record their claims, there was little reason for people to remain at Roosevelt.³⁶

Following the spring breakup of the Upper Kantishna’s ice, many miners left the district on the various boats that had spent the winter on the river. These included: the *Tanana Chief*, located about four miles below the Bearpaw River³⁷; the steamer *Tana*, about halfway between Bearpaw and Roosevelt; the *Pup* at Roosevelt; and the *Zodiac* near the mouth of the Bearpaw.³⁸

In subsequent years, the population in the Kantishna District was low. In 1906, only four people resided at Roosevelt; four at Diamond; and twelve at Glacier. In 1908, a local newspaper reported, “Nothing is left of either Roosevelt or Glacier which once gave evidence of being cities of considerable importance, except the Foster trading post at Glacier.” Only twenty-six men and two women spent the winter in the district. These numbers rose during the summer months when mining and prospecting activities occurred. During the season of 1910, there were about sixty miners in the spring and forty-five men in late summer. According to Bundtzen, about thirty-five to fifty placer miners usually remained in the Kantishna district with a few years when the numbers spiked. Most residents spent their summers at Eureka (formerly Kantishna) and their winters at Glacier, Roosevelt, and Diamond where timber and game were available. Only a few people resided at Eureka throughout the year.³⁹

From 1906 to the late 1910’s, the Kantishna District miners relied upon commercial boat operators for travel and transportation services to Diamond on the Bearpaw River. Among the boats that participated in this trade included the steamer *Dusty Diamond* in 1906; the steamer

³⁷ Another report from Diamond City, dated November 5, stated that the *Tanana Chief* was tied up six miles below the mouth of the Bearpaw River. *Nome Tri-Weekly News*, January 13, 1906, 1, 2.

³⁸ *Dawson Daily News*, December 22, 1905, 1.

³⁹ *Fairbanks Daily Times*, December 24, 1906; *Tanana Tribune*, September 29, 1908, 4; *Fairbanks Daily News-Miner* (hereafter FDNM), June 8, 1910, 2, and August 20, 1910, 4; and Bundtzen 1978, 152.

Florence S. in 1906-08; and the steamer *Pup* in 1908. In June 1906 the *Dusty Diamond* reportedly made the round trip from Fairbanks to Diamond City in six days.⁴⁰ When in 1910 Kantishna residents were unable to find a steamboat to transport supplies, they chartered Nels Henderson's launch to transport freight trip to Diamond. Kantishna miners probably continued to rely upon commercial operators like Henderson for their annual supply of groceries and equipment. In the summer of 1913, for example, Henderson transported W. R. Taylor and his winter supplies and equipment to the Upper Kantishna. He later made another trip up the river, this time in September for other miners, and was planning to make another trip before the navigation season ended. In the spring of 1915 Henderson returned to Fairbanks from the Upper Kantishna with several Kantishna miners on board.⁴¹ In 1918 the steam launch *Bluebird* and power barge *Elmer G* were used to transport freight to Diamond. In the spring, the steam launch *Bluebird* and barge transported about twelve tons of supplies.⁴² In late August 1918, power barge *Elmer G* delivered seven or ten tons of provisions and mining supplies.⁴³ Others launches that may have participated in this trade include the launch *Victory*, which was chartered in 1918 by a U.S. Bureau of Mines official for a trip to the Kantishna mines, and the launch *Scripp*, which advertised transportation services on the Kantishna in the local newspaper.⁴⁴

In the decade following the Kantishna gold rush, commercial boats did not ascend the Kantishna River to Roosevelt on a regular basis. Other than a report that the steamer *Dusty Diamond* in June 1906 landed two passengers at Roosevelt, the local newspapers made no mention of boat traffic to Roosevelt in this period.⁴⁵ There are, however, occasional reports of relatively large boats proceeding beyond Roosevelt to Lake Minchumina.

Kantishna District Mining Boom, 1919-23

Following the First World War, the Kantishna District experienced a mining boom. Thomas P. Aitken, a well known mine investor in Alaska, undertook a project to develop a silver mine. Both the Mt. McKinley Gold Placers, Inc., and the Kantishna Hydraulic Mining Company began placer mining operations in the district. All three mining companies used boats for travel and transportation to Diamond and Roosevelt. To aid these mining developments, the Alaska Road Commission improved a road from Roosevelt to the mining district.

Hard Rock Mining

Beginning in the mid 1910's, hard-rock miners in the Kantishna District searched for an economical way to move large tonnages of ore to market. They ultimately decided that ore could be transported by horse and sled from the mines to the Kantishna River during the winter months. The ore could then be transported to the Tanana River by small riverboats, loaded onto large barges which steamboats could push down the Tanana and Yukon Rivers to St. Michael for

trans-shipment by ocean-going vessels to the smelter in Tacoma, Washington. The cost of this operation was so high that only the richest ore could be shipped, the miners were forced to leave the rest in the ground until transportation costs were reduced.

Miners first attempted to put this plan in operation during the First World War, when the price for antimony rose to such heights that a profit could be made. In 1916, W. R. Taylor, who held valuable antimony prospects, leased mining property to a well known mine investor, Col. W. L. Stevenson of Skagway, reportedly for \$45,000. According to Taylor, the plan was to ship a thousand tons of ore or more to the States that summer. The ore would be transported by two big Jeffery quads (motor trucks) over a twenty-mile-long road to the confluence of the McKinley Fork and Kantishna River, located about four miles above the site of Roosevelt.⁴⁶ With the opening of navigation, the ore would then be loaded onto barges and taken by small steamboat 150 miles down the river to the Tanana River, where it would be loaded onto the large barges of the American-Yukon Navigation Company for shipment to St. Michael at the mouth of the Yukon River.⁴⁷

It is not clear from the available records whether the miners succeeded in their plan. According to the USGS, miners mined and stacked approximately 150 tons of antimony ore, and some of it was hauled to Roosevelt. It is not known whether the ore was shipped to St. Michael and then to the States. Writing in 1917, Capps of the USGS reported that the ore had not reached the market.⁴⁸

In 1919 Thomas P. Aitken succeeded in putting this plan into operation. For three years (1919-21) Aitken mined the Quigley silver-lead ore property under lease. In the spring of 1919, he sent a crew with supplies, a complete blacksmith shop, a considerable quantity of drill steel, and horses on a large power scow and a small gasoline launch to Roosevelt. From this point the men were to improve a pack trail to the mining property, a distance of approximately 27 miles. According to James Haney, who was in charge of the operation, the scow named the *Mary* (owned and operated by Charles McGonagal) was specially built at Fairbanks during the last winter for the service.⁴⁹ The scow made several trips between Nenana and Roosevelt, carrying supplies to the miners. One round-trip reportedly was made in four days.⁵⁰

Encouraged by the assay results from the U.S. Bureau of Mines station at Fairbanks, Aitken decided to continue development work with a larger force and placed his brother, W. H. Aitken, in charge of the work. The large steamboat, the *Shusana*, was chartered to deliver supplies for the winter to Roosevelt.⁵¹ In early September 1919, the steamer *Shusana* and two gasoline boats (George Moody's launch and Jimmy Moore's launch) transported some 200 tons of supplies and equipment for Aitken and other miners to Roosevelt. Teamster Ed Bartlett was hired to haul the supplies from Roosevelt to the mine and ore from the mine to Roosevelt. Bartlett sent in four horses on the steamer *Shusana*, and intended to drive the remainder (about a dozen) overland to

⁴⁶ Capps 1919, 108. In the winter of 1916, Roosevelt was "almost completely deserted." Capps 1919, 18 and 76.

⁴⁷ *Fairbanks Daily Times*, February 18, 1916, 2, and July 13, 1916, 3; and FDNM October 6, 1916, 4.

⁴⁸ Capps 1919, 107; White, 332; and Wells, 354. Wells stated that a few tons of antimony ore was also mined in 1905.

⁴⁹ *Nenana Daily News*, May 29, 1919, 1.

⁵⁰ *Nenana Daily News*, June 4, 1919, 4, and July 3, 1919, 4.

⁵¹ *Nenana Daily News*, July 9, 1919, 3; August 29, 1919, 4.

the mine.⁵² According to Captain Oscar Webber, the *Shusana* transported approximately 100 tons of supplies to Roosevelt Landing in two trips.⁵³ When it left Tolovana in late September, many local residents suspected that low water in the Kantishna River would prevent the steamer from reaching Roosevelt. They were surprised when on October 4 the steamer, its wheel and after part sheathed with ice from the cold weather, arrived at Nenana with two empty barges in tow. The steamer required six days to make the trip from Roosevelt to Nenana.⁵⁴

Freighters George Moody and James Moore were not as fortunate. In late September 1919, the two men used their launches to haul about twenty-five tons of supplies for Aitken and others to Roosevelt, including a stock of general supplies for a store at the new town of Kantishna. In anticipation of a mining boom, miners had laid out a townsite on Moose Creek, at the mouth of Eureka Creek, and named it Kantishna. The new town was approximately thirty miles from Roosevelt. U.S. Commissioner C. Herb Wilson, who handled the sale of townsite lots for the owners (Joe and Fannie Quigley) was the storekeeper. On the return voyage, Moody and Moore encountered a blizzard and the river began running heavy with ice. They sought safety on the Bearpaw River, hoping that the weather would clear, but, on October 3, that river froze, forcing the men to leave the launches in the Bearpaw River for the winter. In five days, the five men walked out of the country. They had to 'siwash' it for three nights without blankets, and one night was so cold they could not sleep.⁵⁵

During the winter of 1919-20, Aitken's crew of fourteen or fifteen men worked day and night at the mine. Only the richest ore, reportedly averaging \$500 per ton, was selected and sacked for the market. By mid December Bartlett, the teamster, had repaired the trail, built relay camps at Moose Creek, Bear Creek, and Roosevelt, and landed between 75 and 100 tons of ore to the foot of the hill near the mine. He used two-horse teams to move the ore from the mine to the foot of the hill; three four-horse rigs were then used to transport the ore to Roosevelt in relays. The first load of ore reached Roosevelt on December 11.⁵⁶

By the spring of 1920, Aitken perhaps had as much as 800 tons of ore at Roosevelt for shipment to market. The American-Yukon Navigation Company was contracted to transport the ore from Roosevelt to St. Michael at the mouth of the Yukon River for trans-shipment to Tacoma, Washington. Early in the season, when water levels were high, the light draft steamer *Reliance* made two round-trips from the mouth of the Kantishna River to Roosevelt, transporting perhaps as much as 333 tons of ore to barges (e.g., the *Montana*) stationed at the river's mouth. On its third trip, the steamer was stopped at the mouth of the Bearpaw River by low water. By one estimate, up to 500 tons of ore remained at Roosevelt. Andy Livingston, the master of steamer *Reliance*, subsequently used the powerboat *Kestrel* to haul the ore to the Tanana, making at least two round-trips. In late September, the company had to stop work because low water prevented its boat from proceeding beyond the mouth of the Bearpaw River. According to one account, 75 to 100 tons of ore remained at Roosevelt for shipment.⁵⁷

⁵² *Nenana Daily News*, September 5, 1919, 4; September 8, 1919, 4.

⁵³ FDNM, October 7, 1919, 1.

⁵⁴ *Nenana Daily News*, September 22, 1919, 1, and October 4, 1919, 4.

⁵⁵ *Nenana Daily News*, August 29, 1919, 1; September 22, 1919, 4; September 24, 1919, 4; and October 13, 1919, 4.

⁵⁶ *Nenana Daily News*, December 15, 1919, 4.

⁵⁷ *Nenana Daily News*, April 17, 1920, 4; May 14, 1920, 4; June 1, 1920, 1; June 11, 1920, 4; June 18, 1920, 4; August 17, 1920, 4; September 23, 1920, 3; and December 30, 1920, 2, 3.

By February 1921, Aitken had decided to abandon mine operations, citing high costs, an insufficient quantity of high-grade ore, and differences of opinion with the property owner over the lease agreement.⁵⁸ During the winter of 1920-21, Bartlett was again engaged to transport ore to Roosevelt Landing, and the steamer *Reliance* was chartered to transport the ore to the mouth of the Kantishna River. Perhaps up to 600 tons of ore was transported that season. By early July, the steamer had made two round-trips to Roosevelt. On its trips up the Kantishna River, the steamer also carried supplies and equipment for Kantishna miners and prospectors. On its first voyage up the river, the steamer carried a load of approximately four tons of supplies.⁵⁹

Hydraulic Mining Operations

In the early 1920's, several hydraulic mining companies in the Kantishna district relied heavily on launches and barges for travel and transportation to Diamond and Roosevelt. The two companies, organized by residents of Fairbanks and Nenana, operated on creeks in the headwaters of the Bearpaw River. The Mt. McKinley Gold Placers, headed by Joseph C. Van Orsdel and W. R. Taylor, had ground on Caribou Creek.⁶⁰ The Kantishna Hydraulic Company was led by Fairbanks residents Dr. J. A. Sutherland, Sylvester Howell, Carl Selberg, and others. The company held ground on Moose Creek. Together, the two companies employed about sixty men during the 1922 season.⁶¹

Riverboat operators George Black, George Moody, and Jimmy Moore were hired by the mining companies, as well as other miners in the area, to provide transportation services to Diamond and Roosevelt. In 1920 Black also held the government contract to deliver mail to Roosevelt four times a year during the open season. During the seasons of 1920, 1921, and 1922, Black used the steamer *Pioneer*. In 1920, he hauled about twenty tons of supplies and provisions, besides horses, on two barges to Roosevelt for the Kantishna Hydraulic Mining Company. In 1921 he made at least two trips up the Kantishna River, the last trip as far upstream as Lake Minchumina. In 1922 Black was under contract to McKinley Gold Placers to transport freight to Diamond. In the spring of 1923 the steamer *Pioneer* made at least two round trips to the Kantishna district. On its first trip, the steamer's cargo included general freight and ARC supplies for Roosevelt. On its second trip, it returned to Nenana with eight or nine tons of galena ore.⁶²

⁵⁸ "The cost of transporting ore from mine to smelter was \$75 a ton—an uneconomic trip unless the silver assay was at least 100 ounces a ton; silver was worth nearly \$1 an ounce in 1920. Lower-grade ores today remain on the dumps." Bundtzen, Spring 1978, 156.

⁵⁹ *Nenana Daily News*, November 30, 1921, 1; February 8, 1921, 2; June 7, 1921, 4. Aitken reportedly mined and shipped a total of about 1,200 tons of silver-lead ore. Bundtzen, Spring 1978, 155.

⁶⁰ Van Orsdel, who was the U.S Commissioner at Kantishna, also operated a launch, the *Vanity*. *Nenana Daily News*, July 20, 1918, 3.

⁶¹ *Nenana News*, July 6, 1922, 2. Dr. Sutherland of Fairbanks operated a launch, the *Siwash*. FDNM, July 23, 1918, 4. He reportedly made a record-setting run from Roosevelt to Nenana in twenty-nine hours and five minutes. *Nenana News*, June 24, 1922, 4.

⁶² George Moody had the mail contract in 1921 and 1922. For reports on mail trips, see *Nenana News*, June 12, 1920, 1; August 20, 1921, 3; August 1, 1922, 2; August 12, 1922, 4; August 17, 1922, 2; and September 7, 1922, 4. In the spring of 1923 the Post Office Department advertised for bids to make four round-trips between Nenana and Kantishna during the open season, the contractor carrying up to 400 pounds of mail on each one-way trip. It is not presently known whether a mail contract was awarded. See *Nenana News*, April 3, 1923, 2. For information regarding annual riverboat trips, see FDNM, June 28, 1918, 4; *Nenana News*, June 8, 1921, 1; *Nenana Daily News*, August 30, 1921, 4; September 20, 1921, 4; September 29, 1921, 2; June 13, 1922, 1; September 12, 1922, 1; June 12, 1923, 2; June 28, 1923, 4; and *Nenana News*, July 5, 1923, 1.

George Moody, James G. Moore, Sr., and his son, “Jimmy,” were also popular commercial carriers on the Kantishna River at this time. Moody, who had the federal contract to deliver mail to Roosevelt four times during the open season in 1921 and 1922, may have operated on the river more often than Moore. (Other than they operated on the Kantishna River to Diamond and Roosevelt, little is known about the Moores’s operations.) In 1921 Moody was also transporting passengers and mining freight to Roosevelt and returning to Nenana with passengers and ore samples. In 1922 the McKinley Gold Placers, Inc., purchased Moody’s launch, renamed it the *Jolly Rover* [or the *Kantishna*], and used it for travel and transportation to the company’s camp at Diamond.⁶³ Moody continued to operate a powerboat, the *Bertha*, between Roosevelt and Nenana. The local newspapers reported little about his activities other than he was operating on the river in 1921 and 1922. The last mention of Moody on the Kantishna was reported on October 3, 1922, when the *Nenana News* noted the arrival of the *Bertha* from Roosevelt with mail and a dozen passengers.⁶⁴

From time to time, miners chartered other freight boats. These included the steamer *Carl White*, the powerboat *Kestrel*, the “Wigger power boat,” the steamer *Teddy H.*, and the sidewheel gasboat, the *Mutt*. In 1920 the Mt. McKinley Gold Placers, Inc., chartered the steamer *Carl White* to haul supplies and a new tractor for use in hauling supplies from Diamond to the company’s property. On its last voyage of the season, the powerboat *Kestrel* also transported the company’s freight to the mouth of the Bearpaw River.⁶⁵ In 1920 and 1921, the Kantishna Hydraulic Mining Company used the “Wigger power boat” to transport about sixty tons of equipment and supplies to Roosevelt. In 1922 the company chartered Sam Dubin’s steamer *Teddy H* and two barges to haul passengers and freight, including eight head of horses, to Roosevelt.⁶⁶ The Kantishna Transportation Company of Nenana operated the sidewheel gas boat *Mutt* to Roosevelt and Diamond only one season (1923). The company, headed by C.E. Neuser and associates, advertised a “regular and reliable service” from Nenana to the Upper Kantishna on the 15th and 30th of each month, beginning on or about May 22.⁶⁷

Commercial Boating to Roosevelt, 1924-1933

After 1923, the year that the Alaska Railroad from Seward to Fairbanks was completed, mining and associated riverboat operations in the Kantishna District declined significantly. In 1925 only thirteen men were mining in the Kantishna district.⁶⁸ In 1926, a local newspaper reporter interviewed Joe Quigley, a well known miner in the district, on the future of the district: “It is

⁶³ *Nenana News*, June 13, 1922, 1. In 1922 and 1923, the company also used its own launch, the *McKinley*, for use between Nenana and Diamond. *Nenana News*, July 22, 1922, 1; July 29, 1922, 1; September 12, 1922, 1 and 2; and May 24, 1923, 4.

⁶⁷ The *Mutt* made a round-trip from Nenana to Roosevelt in eight days. C. E. Neuser and associates purchased the trading post of Dr. A. B. Carmichael in the Kantishna district. *Nenana News*, April 17, 1923, 1, May 19, 1923, 2, May 24, 1923, 4, June 12, 1923, 2, 3, June 28, 1923, 2, and August 2, 1923, 4.

⁶⁸ Bundstzen, Spring 1978, 156.

his belief that mining in the Kantishna will be at more or less of a standstill until adequate transportation facilities are provided. With the system now in use—either hauling ore to Roosevelt on the Kantishna River for shipment in the summer, or hauling to the railroad—values must be unusually high to yield a profit and it is practically impossible to depend upon such transportation methods for large scale operations.”⁶⁹ With the possible exception of Quigley in 1925, miners no longer relied upon the Kantishna River for shipping ore to market.⁷⁰

Instead, miners and others in the Kantishna district relied upon airplanes and overland routes for travel and transportation. By the end of the 1920’s, airplanes were common conveyances for travelers and small quantities of freight. The aviation age arrived at Kantishna in 1924. On June 19, Carl Ben Eielson landed a miner named Jack Tobin “within 200 yards of his cabin door” at Copper Mountain rather than attempt a landing at a landing field near the Quigley properties, fifteen miles away. In September Noel Wien made the second commercial flight into the Kantishna with H. C. Ingram as passenger. He was bound for Eureka, but was forced by low clouds to land on a sandbar at Glacier. In 1926 Joe Crosson landed Joe Quigley at Moose Creek near Eureka. Later in the summer, the Territorial Road Commission contracted with John Anderson of Wonder Lake to construct an aviation field on a bench above Moose Creek near the mouth of Lake Creek. Afterwards, local miners frequently took passage on planes to Moose Creek.⁷¹ In 1937, miners had to pay ten cents a pound to have supplies flown to the creeks. This was too costly for most miners.⁷²

With the construction of the Mt. McKinley Park road, 84 miles long in the national park, the Kantishna miners had summer access to their properties. (Winter access was provided by the Lignite-Stampede-Caribou Creek tractor trail.⁷³) The road extends from the Alaska Railroad station at Mt. McKinley Park to Wonder Lake. The Alaska Road Commission (ARC) began work on the road from the railroad in the late 1920s. By 1930 trucks had been taken over the road as far as Stony Creek. Horses were then used on a trail to Wonder Lake and nearby mines.⁷⁴ During the winter months, miners used tractors on the road to transport supplies to the mines. By the fall of 1936, according to Joe Quigley, the Park road had been “stripped” to Wonder Lake, only five miles from his home.⁷⁵ By the spring of 1937, the road to Wonder Lake was suitable for heavy freighting by trucks. Partly to aid miners in the district and partly to

⁶⁹ FDNM, July 14, 1926, 1.

⁷⁰ During the winter of 1924-25, Quigley contracted with Harry Warrant to haul thirty-two tons of ore from his mine to Roosevelt. Quigley planned to have it taken out by steamer next summer. No documentary evidence was found that Quigley’s ore was hauled out the following summer. FDNM, January 7, 1925, 3.

⁷¹ FDNM, June 19, 1924, 8; 4, September 27, 1924, 8, October 11, 1924, 4, July 27, 1926, 1, July 28, 1926, 1, July 31, 1926, 8, August 27, 1926, 4, and June 21, 1927, 8.

⁷² FDNM, May 11, 1937, 4.

⁷³ In the winter of 1939, the Caribou Mines Company used tractors on this trail to move a dryland dredge to Caribou Creek. FDNM, February 3, 1939, 2; February 21, 1939, 7; February 28, 1939, 7, April 17, 1939, 7, August 30, 1939, 2.

⁷⁴ Capps 1932, 235-236.

⁷⁵ FDNM, October 15, 1936, 4. In the fall of that year, the Mount McKinley Tourist and Transportation Company hauled sixty tons of supplies from the Park Station on the Alaska Railroad to Mount Eielson (formerly Copper Mountain). A tractor was then used to transport the supplies to Quigley’s properties. FDNM, November 7, 1933, 1. In the winter of 1936 miners Ernie Mauer, Joe Meehling, and Mike Siler transported mining equipment and supplies from the Park station to the Kantishna with a new Caterpillar bulldozer. FDNM, January 11, 1936, 8; January 14, 1936, 8.

provide tourists in the park an opportunity to view mining operations, the ARC continued to work on the project in the late 1930's. In the summer of 1940, the ARC completed 4.5 miles of road outside of the north boundary of the Mt. McKinley National Park to the Kantishna mining district.⁷⁶

During the 1920's and into the 1930's, traders, fur farm operators, and roadhouse keepers replaced miners as the principal commercial operators on the upper Kantishna River. Roosevelt with its roadhouse and several trading posts was an important year-round stopover for travelers.⁷⁷ In 1924 a local newspaper identified two trading post operators at Roosevelt: L. C. Olson and W. B. Rodman. Both men owned boats. W. B. Rodman was reported leaving Nenana in late July with mail and ten tons of freight for Roosevelt. In the spring of 1924, Ralph Norris's launch, the *Mutt*, transported passengers and miners' freight to Roosevelt, and returned with nine passengers, including trappers from Roosevelt and Lake Minchumina. John R. Folgers, who operated a trading post in the Kantishna, used his own boat to freight supplies from Nenana. He was still there four years later. In the spring of 1928, A. G. Vashon, a fur trader, reportedly left Tanana on Folgers's gasoline launch for a trip up the Kantishna River.⁷⁸

By the late 1920's, as the winter mail trails fell in disuse, most trading posts and roadhouses on the Upper Kantishna and Upper Kuskokwim districts were abandoned. Most travelers relied upon airplanes to travel to the Upper Kantishna. In 1927, as Emil Hansen, proprietor of the Roosevelt roadhouse, claimed that his business was on the decline, "due to the invasion of airplanes." He was quoted as saying, "Heretofore, . . . anyone headed for McGrath and Iditarod districts would stop over at my roadhouse, but now the planes carry them straight on through."⁷⁹ The final blow came in 1930 when the Post Office Department contracted with an airline company to deliver the mail to McGrath.

Captain George Black may have been the last commercial freighter on the Upper Kantishna before the outbreak of the Second World War. Each year, he made at least one trip up the Kantishna River with freight for miners and fox farmers. In late July 1927, he made a trip to Diamond and Roosevelt with the steamer *Pioneer*. In the spring of 1928, he hauled a load of lumber and foodstuffs on the steamer *Pioneer* and a scow to Diamond and possibly Lake Minchumina. In 1929, he hauled a large cargo of lumber, wire, and food to John Hansen's fox ranch, located about twenty-five miles below Roosevelt. The Fairbanks newspaper mentioned Black's boat, the *Bertha*, making freighting trips to the upper Kantishna in 1930, 1931, and 1933. Roosevelt was specifically identified as the destination in 1930. It is probable that Roosevelt was also the destination in 1931 and 1933; the newspaper simply identified "the Kantishna" as

⁷⁶ FDNM, September 19, 1940, 5.

⁷⁷ Roosevelt was an important stop on the winter mail trail from the Alaska Railroad to McGrath on the Kuskokwim River. Between 350 and 500 people traveled over the winter trail each year in the period 1925 to 1930. Between thirty and forty tons of freight were transported annually during the same time period. Much of this traffic was probably related to the mail service. U.S., Board of Road Commissioners for Alaska, *Annual Report*, 1922, 63-63; and U.S., Board of Road Commissioners for Alaska, *Annual Report*, 1924, 105-106; *Kusko Times*, January 27, September 1, November 14, 1923, February 16, 1924, April 17, 1926; and U.S., Board of Road Commissioners for Alaska, *Annual Report*, 1932, 19.

⁷⁸ FDNM, June 2, 1924, 4, July 5, 1924, 8, July 29, 1924, 5, May 15, 1928, 5; and *Anchorage Daily Times*, June 12, 1924, 4.

⁷⁹ FDNM, January 3, 1927, 8.

the destination. In 1933 Black may have continued upriver to Lake Minchumina, because some of the freight was reportedly destined for the Kuskokwim region.⁸⁰

Evidence of Commerce: Roosevelt to Lake Minchumina Reach

The Kantishna River, Birch Creek, and Muddy River provide commercial freighters access to Lake Minchumina. Regular commercial riverboat operations to Lake Minchumina occurred from the 1920's to the early 1960's. During the 1920's and early 1930's commercial operators delivered freight to traders and fox farmers at the lake. During the 1940's and 1950's, the Civil Aeronautics Authority and the Federal Aviation Agency supplied its station at the lake by boat and airplane. During the early 1960's a local resident at the lake used a boat to transport fuel needed to provide electrical power to local residents.

The first known instance of commercial boat travel to Lake Minchumina occurred in 1914. In the summer of that year Nels Henderson transported Stephen Foster and four tons of freight to the lake. The two men reportedly intended to start a fox farm, a trading post, and a big game hunting guide business at the lake. It is highly unlikely that they succeeded in their plans, although, later in the summer, Henderson returned to Fairbanks with a cargo of live foxes and mink for the Alaska Fur and Silver Fox Farms at Fairbanks. Foster would not return to Fairbanks for another two years.⁸¹

During the 1920s, freighters like George Black and George C. Moody were occasionally hired to transport prospectors and government officials to the lake. In the spring of 1921, Black transported six prospectors and their outfits on the *Pioneer* and a barge to Lake Minchumina.⁸² In the summer of 1922, the Nenana newspaper reported that Black again intended to go up the Kantishna River to the lake. In the spring of 1923, law enforcement officials wanting to investigate the death of a trapper named Henry Bock, hired Moody's launch to take them to the lake. Two years later, Moody transported federal and territorial engineers who located and established an emergency airplane landing field at the lake. Not long thereafter, Captain C. E. Neuse's stern wheel gasboat *Mutt* arrived at the lake with supplies and equipment for several trappers. Neuser reported "a very satisfactory trip . . . without any trouble of any kind." In late July the steamer made another trip to the lake, this time transporting five men and their outfits.⁸³

⁸⁰ FDNM, July 23, 1927, 8, June 19, 1928, 8, September 30, 1929, 8, August 7, 1930, 8, August 19, 1930, 8, September 12, 1931, 4, May 18, 1933, 5.

⁸¹ *Fairbanks Daily Times*, July 17, 1914, 2, September 25, 1911, 1, June 16, 1916, 5, and July 12, 1916, 2; and FDNM, July 10, 1918, 3. He may have returned to the lake country to trap a month later. Foster later became a game warden. In 1918 he went to the lake on Clarence Boatman's launch. Johnson, Gudgel-Holmes, and Levy, p. 81, also state Foster and Henderson were not successful in establishing a fox farm and trading post at the lake.

⁸² Black probably provided the following information: "A barge loaded with provisions and also equipped as a cabin for first class passengers, will be towed up streams to the lake, and will probably supply the means for some cussing when the Muddy river, Minchumina's outlet, is reached. The Muddy river is sluggish, and has a reputation for sharp curves which at times, prove troublesome to the shorter motor craft. It is practically impossible to pole a boat in the Muddy, owing to depth and towing is usually resorted to. If the wheel refuses to turn in making some of the curves, Captain Black may be compelled to fit the 'Pioneer' with oarlocks." FDNM June 8, 1921, 1.

⁸³ FDNM, August 17, 1922, 2, September 7, 1922, May 17, 1923, 4, May 21, 1923, 1, May 31, 1923, 4, June 2, 1923, 3 June 18, 1925, 1, June 23, 1925, 4, July 7, 1925, 2; *Nenana News*, July 14, 1923, 8, August 2, 1923, 4.

During most of the 1920's, Edward K. Kammersgaard's sternwheel boat was a common sight on this reach of the river system. Kammersgaard, who spent his first winter hunting and trapping at the lake in 1917-18, eventually established a roadhouse and trading post at Lake Minchumina's outlet.⁸⁴ In 1925, when Upper Kuskokwim residents were lobbying for a summer mail service from Nenana to McGrath by way of the Kantishna River and Lake Minchumina, Kammersgaard claimed to be the only person operating a commercial boat to the lake. Observing that the water had never been too low for his boat to reach Lake Minchumina, he claimed that the proposed mail service was practicable. Depending upon the size of the party, he charged about \$200 for the eleven-day round trip between Nenana and the lake. One man and his board cost \$50. He would also land freight at the lake for four cents a pound.⁸⁵

Kammersgaard may have quit riverboat operations on the Upper Kantishna in 1927 when he put his roadhouse up for sale. After 1925 there is no mention of his boat in the local newspapers. Instead, the newspapers frequently mention him traveling to and from the lake by airplane. In 1929, he made perhaps his last trip by boat to the lake with Gene Miller and his wife in their launch. Circumnavigating the lake, they reported seeing only one Native family at the head of Muddy River and an "old Indian woman" who lived alone and had "a hard time getting enough food to live."⁸⁶ After a previous sale of the roadhouse fell through, Kammersgaard again advertised his roadhouse and trading post for sale in the winter of 1929, touting the location as an "ideal place for fur farm." According to one report, he permanently left the area in 1931.⁸⁷

During the late 1920's, several fur farmers on the Upper Kantishna and at the lake were most likely supplied by boat. Louis Blackburn, R. M. White, and John Hansen were the principal farmers. (Knut Lind also operated a fur farm at the lake, but little is known about it.) Blackburn, who died in Fairbanks in 1932, may have started a fur farm in 1926.⁸⁸ R. M. White, formerly of Anchorage, established a farm at the lake in 1929. Located along the Kantishna River about twenty-five miles below Roosevelt, John Hansen's farm in 1929 was reportedly one of the largest in Alaska, with about 200 red and cross foxes.⁸⁹ The farm was in operation from at least 1922. These farms probably failed a few years after the stock market crash in 1929.

⁸⁴ FDNM, July 10, 1918, 3. According to Val Blackburn, Kammersgaard may have been the first white man to settle at the lake. He was located there from 1917 to 1931. See Bishop, 9 and 10, and Schneider, Gudgel-Holmes, and Dalle-Molle, 79. Johnson, Gudgel-Holmes and Levy cite 1916 as the year when Kammersgaard arrived at the lake. P. 82.

⁸⁵ Anchorage Daily Times, February 16, 1925, 6. Johnson, Gudgel-Holmes and Levy, p. 84, stated that the sternwheeler was forty-five feet long.

⁸⁶ They also learned that earlier in the summer, a young Native woman had committed suicide by jumping from a boat into the lake and drowning herself. The body was recovered. FDNM, September 12, 1929, 8.

⁸⁷ FDNM, January 11, 1929, 8, January 12, 1929, 1, February 7, 1929, 1, July 11, 1929, 8. Kammersgaard advertised his roadhouse for sale as early as 1927. He apparently sold it to G. E. Young, because in the summer of 1929 he sued Young over the title to the roadhouse and won the case. See FDNM, July 12, 1929, 8, February 10, 1930, 5.

⁸⁸ FDNM, March 15, 1926, 7, and July 1, 1932, 8. According to Bishop, Kammersgaard was the first one to operate a fur farm, but this has not been confirmed. See Bishop, 10. He said four fur farms were started in the late 1920's thru the early 1930's. White reportedly operated the farm at the head of Muddy River until 1934. The property was donated to the University of Alaska. See Schneider, et al., 1984, 79, and Students and Teachers of Minchumina Community School, 20. Jesse Yoder was also identified as someone who may have built a fur farm in 1928. This has not been confirmed.

⁸⁹ FDNM, December 4, 1929, 4. Johnson, Gudgel-Holmes and Levy, pp. 86 and 88, state that White operated the mink farm and roadhouse until 1934. It was the last one.

The local newspapers seldom mentioned that these farms were supplied by boat. In 1929 the Fairbanks newspaper reported that George Black had made two trips to the Upper Kantishna and Lake Minchumina with cargo for fur farmers. On the first trip, he hauled eighteen tons of supplies to Hansen's fur farm, and returned to Fairbanks with twelve tons of dried fish. In late September, he reportedly returned to Fairbanks after a two weeks' voyage to Lake Minchumina with fifteen tons of freight, most of it for fur farmers. Five and a half tons was for White, who was then starting a mink farm.⁹⁰

CAA/FAA Barge Operations

In 1940, the new Civil Aeronautics Authority (CAA) launched a major program to construct airplane landing fields and radio stations in Alaska. Lake Minchumina was selected as the site of an important radio range station on the Fairbanks to McGrath air route. The CAA's station at Lake Minchumina operated from 1941 to 1969.⁹¹ From 1942 to 1954 or 1955, the agency annually used boats and barges to transport groceries and fuel to the station, consisting of about a dozen families.⁹² Thereafter, airplanes were substituted as a more economical alternative.

Other than what was reported in the local newspapers, few details are known about the founding of the Minchumina station. In the summer of 1941, some forty men were reported at work on the project, which was expected to be completed in three months. In January 1941, the Fairbanks paper reported that Carl Rudberg of Fairbanks was awarded a contract to move 360 tons of supplies and equipment from Nenana to the lake.⁹³ Tractors, planes, and boats were used. In the summer of 1941, nearly two dozen CAA employees and their supplies were transported to the lake by airplane. An amphibian plane and a pontoon plane made three trips a day for three days, each plane carrying 1,700 pounds of freight. There were forty men at work. They expected to finish the project in three months. In addition, river freighters Herman Olson, Carl Hult and George Black were hired to haul freight to the lake.⁹⁴

Unlike Olson and Hult, who were trappers in the Upper Kantishna district, Black was a longtime riverboat man in Interior Alaska. The Fairbanks newspaper reported in August 1941 that Black's *MS Idler* and a barge were to deliver a load of machinery and fuel oil to the Minchumina airfield, a total of 135 tons. The cargo included a "tractor-dragline combination, bulldozer and trucks."⁹⁵ The *MS Idler* spent three weeks "going and coming" on the river system. Afterwards, Captain Black commented, "the going [was] easy most of the way, but encountered shoals on a

⁹⁰ FDNM, September 30, 1929, 8.

⁹¹ Bishop 1978, 11. The Civil Aeronautics Authority was succeeded by the Civil Aeronautics Administration which in turn became the Federal Aviation Agency.

⁹² It is not known exactly when the FAA's annual voyages ceased. Lindsay cited the year 1954; Collins, 1955. See Gudge-Holmes 1979, 110; and Warren "Slats" Lindsay to Mr. and Mrs. Holmes, July 4, 1982, in Gudge-Holmes, Records.

⁹³ FDNM, January 16, 1941, 7. In the spring of 1942 another cat train under Morrison-Knudsen may have traveled from Nenana to McGrath via Lake Minchumina.

⁹⁴ FDNM, July 31, 1941, 2, and November 26, 1941, 5.

⁹⁵ FDNM, August 18, 1941, 4. The *MV Idler* was 62 feet long, had an eighteen-foot beam, and could carry up to ten tons. REFN 07187-00501. Gudge-Holmes, 1979, 101, states that the boat was 85 feet long.

portion of the upper stretches. The last 80 miles, which was through the Mud River to the entrance to the lake is full [of] mud flats, but with good depth of water.”⁹⁶

A former longtime employee of the FAA at Lake Minchumina, Dick Collins described these annual voyages.⁹⁷ From 1942 to 1956, Einer and Emil Hansen, brothers of John Hansen, the fur farmer, were hired to operate two “J” boats, each approximately 25 feet long and 12 to 16 feet wide, one to pull and the other to push a barge up the rivers.⁹⁸ Three or four trips to the lake, each lasting ten to twelve days, were made every season. Sometimes, when low water was encountered, it was necessary to lighten the barges by unloading cargo onto the riverbank and then proceed to deeper water with the remaining cargo. The boats would then return to the site and transport the remaining cargo upriver. Collins recalled only one year (1953) when the boats, unable to reach the lake, had to be unloaded about a quarter mile below the lake. (He did not mention how the freight was transported from this site to the station.) The “J” boats were used on this run until 1955 when the FAA transferred a larger and more powerful boat from the Koyukuk River run to Bettles. The boat made several trips to the lake that season and, as expected, made the trip in far less time (three days as opposed to ten to twelve days).⁹⁹

Warren “Slats” Lindsay, another longtime employee of the FAA at Nenana, participated in the FAA’s last voyage to Lake Minchumina. He was on one of the last voyages up the river with tugboats CIVAR 20 and CIVAR 29 (“Taku Chief”), which he recalled were 50 feet or more long. From Nenana, the tugboats and barges were taken down the Tanana River and up the Kantishna River to a point just past Roosevelt. He described the subsequent voyage as follows:

Just past Roosevelt we tie the barges to the bank and untie the tugs from the barges. The tugs have been ‘pushing’ the barges to this point, from now until we reach the Lake, we pull the barges. In order to make the barges ‘track’ we cut two large birch trees per barge and lash them leaves and all to the rear corners of the barges. This acts as a drag and helps the tugs control them better.

So now we turn off the Kantishna River onto the Muddy River which is streight [sic] on each end and crooked as all heck in between. The Muddy River is very narrow and deep and so crooked that at times the tug would be passing each other heading in opposite direction with only ten feet of land separating them. So we get close to the lake and tie up so that we can send a kicker boat to the mouth of the Muddy to clear the logs etc, so the tugs can get through onto the lake. We cross the lake going past the Island and on to the CAA station to unload and head back to Nenana.¹⁰⁰

⁹⁶ FDNM, August 27, 1941, 4.

⁹⁷ The local newspapers noted that Richard Collins as the station manager for the CAA at Minchumina as early as 1953. FDNM, February 20, 1953, 1. His retirement was reported in 1967. FDNM, May 29, 1967, 14.

⁹⁸ In the spring of 1953 the newspaper reported the launching of two “Jay boats,” which Emil and Einer Hansen were to pilot on a trip to Lake Minchumina with a load of oil and supplies. FDNM, May 27, 1953, 11. In the early 1950’s, the Civil Aeronautics Administration operated eight boats in Alaska, all of them over 25 feet in length. See U.S., Congress, House of Representatives 1954, 27.

⁹⁹ Gudgel-Holmes, August 1979, 110. Lindsay recalled that one J boat was sixteen to eighteen feet long.

¹⁰⁰ Warren “Slats” Lindsay, Reedport, Oregon, to Mr. and Mrs. [Charles and Dianne] Holmes, July 4, 1982, Gudgel-Holmes, Records. On a different occasion, he described the river: The river “is very, very crooked and pretty soon you’ll be seeing one barge going one way and then behind the trees you’ll see the other barge going a different way.” See “Transcript of Interview Conducted 1/14/84 by Clifford Cernick with Warren (Slats) Lindsay ‘Last of the FAA Riverboaters’ at Lincoln City, Oregon,” pp. 17-18, in Gudgel-Holmes, Records.

According to Lindsay, the riverboat trips to the lake were not difficult. As he watched a motion picture of the boat trip, he recalled: “The only problem we ever had getting into Lake Minchumina was at the mouth of Mud River. We’d have to take saws and whatnot to saw logjams and what not in order to bring the barges and the tugs through.”¹⁰¹

Holmes’ Barge Operations

Beginning in 1960 Weldon S. “Bill” and Frances M. “Fran” Holmes provided electrical power to Minchumina under the name Semloh Supply. The couple also operated a general store at the lake. Usually, supplies and fuel were flown in from Fairbanks. For a few years, however, Holmes used a tugboat, the *Beaver*, and a barge to transport fuel from Nenana. The riverboat operation ceased, however, when a severe storm damaged the boat and barge on the lake.¹⁰²

Summary

The Kantishna River-Lake Minchumina system was susceptible to navigation for travel, trade, and commerce at the time of statehood. Since the Kantishna gold rush of 1905 to the early 1930’s, commercial riverboats were used to transport passengers, freight, and equipment for miners and fur trappers to Roosevelt. Commercial riverboats were also used during the 1920’s and early 1930’s to deliver freight to traders and fox farmers at the Lake Minchumina. During the 1940’s and 1950’s, the Civil Aeronautics Authority and the Federal Aviation Agency used tugboats and barges to supply its station at the lake. During the 1960’s a local resident at the lake used a boat to transport fuel needed to provide electrical power to local residents.

Jim Lake¹⁰³

Land Status and BLM Navigability Determinations

Jim Lake, approximately 1.75 miles long and 0.75 mile wide, or 500 [840?] acres in area, is located several miles west of Lake Minchumina, in the area of the historic Lake Minchumina Portage. Before the 1940’s, when most people relied upon airplanes for travel purposes, the Portage, approximately fourteen miles long, was integral part of a route of travel between the Tanana and Kuskokwim River basins.

Jim Lake lies in three townships: Tps. 11 and 12 S., R. 25 W., FM, and T. 11 S., R. 24 W., SM. Nearly all lands along the lake are selected under AA-11184 (Native Group), specifically, in Tps. 11 S., Rs. 24 and 25 W., FM. The State of Alaska has also filed a selection application on these

¹⁰¹ *Ibid.* A 1954 photo of two tugboats and a barge on Muddy River is in Gudgel-Holmes Records. The handwritten caption reads, “Lake Minchumina trip Mud River phase at a ‘wide’ place on the Mud. Warren Lindsay.”

¹⁰² Fran Holmes informed Gudgel-Holmes that they barged fuel from Nenana to the lake in the early 1960s. After a storm that “destroyed” the barge and boat in 1964, this operation stopped. Gudgel-Holmes 1979, 110. See also Students and Teachers of Minchumina Community School 1997, 15-16, 36. A photo of the barge appears on p. 17. Bill died in 1979; Fran, in 1997. Both Penny Green (grand-daughter of Holmes) and Groff identified the tugboat as the *Beaver*. See also Groff, 156, and email, Steve Taylor to Mike Brown, August 8, 2006, file AA-094611, BLM Records.

¹⁰³ See USGS Skagway B-3 Quadrangle.

lands under AA-21221 and AA-21222. The remainder of the lakeshore, located in Section 2, T. 12 S., R. 25 W., FM, was conveyed to the State of Alaska under the Mental Health Act (F-028722).

There is evidence that in the early 1960's the BLM determined that Jim Lake was not navigable. The State selected lands in T. 12 S., R. 25 W., FM, including land along the lake in Sec. 2, under the Mental Health Act. In 1963 the BLM issued a tentative approval for the conveyance of these lands. The decision stated, "When the official plat of survey is filed patent will issue excluding navigable waters."¹⁰⁴ In 1967 the lands were surveyed as part of Tract A. Unlike the nearby Lake Minchumina, Jim Lake was not excluded from the survey.¹⁰⁵

In the early 1980's, the BLM reversed its position on the navigability of the lake. The BLM determined that the lake was navigable in T. 12 S., R. 25 W., FM, as well as in other townships where a Native Group and the State had filed selections under ANCSA and the Statehood Act, respectively. Both Minchumina Natives and the State selected lands along the lake in Tps. 11 S., Rs. 24 and 25 W., FM. In 1982 the BLM determined that Jim Lake was navigable in T. 11 S., R. 24 W., FM; and in 1984, in T. 11 S., R. 25 W., FM.¹⁰⁶ In both instances, the BLM asserted that the lake was once an integral part of the historic Lake Minchumina-North Fork Kuskokwim River portage, as follows:

Jim Lake, located near or on the portage trail between Lake Minchumina and North Fork Kuskokwim River has one reference as to its use. This reference was extracted from 'In the Alaska Wilderness' (New York, 1978), by Walter L. Gordon. The author of this report reviewed portions (including maps) of this interesting book that deal with their journey up to the Kantishna and Muddy Rivers to Lake Minchumina and then their portage via Jim Lake to the North Fork Kuskokwim in 1907. Following a sketch map prepared under the direction of Chief Henry, and guided by Natives who lived on Minchumina Lake, the Gordon brothers portaged their gear and canoe overland from Lake Minchumina to Jim Lake. They camped at the Lake and the next day they loaded their canoe crossed Jim Lake and continued overland on a well recognized trail to the North Fork Kuskokwim. (See Inclosures 3, 4, and 5.) It appears from the maps that Jim Lake was an integral part of a Native transportation route from the Yukon to the Kuskokwim basins. The author of this report is uncertain as to whether explorers used Jim Lake or an overland trail about a mile to the west designated winter trail on the USGS Quadrangles. While at Lake Minchumina, the Gordons talked to a few Natives camped on the lake and learned that most of the Natives were at a summer camp near the mountains. How the Natives moved to and from the hunting camps was not specified, however, one must assume given the other transportation alternatives that boatable water bodies were used to whatever extend [sic] possible. Finally, they learned that in earlier years Natives within the Minchumina area were much more numerous and that there were several camps and villages around Lake Minchumina as well as along Foraker River (Kwalana River).

...

Jim Lake seems unique and is frankly somewhat confusing. It appears from maps used by the Gordon brothers that Jim Lake was an integral link in an early route of trade and travel between Tanana and Kuskokwim Natives. It is the author's understanding that if a water body has been used as a highway of commerce and even if that use stops prior to or long before the date of statehood that the water body does

¹⁰⁴ Robert F. Hilton, Chief, Lands Section, Decision, September 11, 1963, file F028722, BLM records.

¹⁰⁵ In accordance with the terms of the DOI-State of Alaska Memorandum of Understanding, which was incorporated into the Submerged Lands Act of 1988, the State will not be charged the acreage of any lake larger than fifty acres where the uplands have not been patented. The BLM has not yet adjusted the acreages on the survey plat.

¹⁰⁶ C. M. Wheeler, "Mt. McKinley #1, FY83," December 13, 1982; Robert D. Arnold to Chief, Division of ANCSA and State Conveyances, December 28, 1982, file F028722, state selections, BLM-ASO records; and "Draft Final Navigability Determination Memo for Minchumina Natives Incorporated in the Mt. McKinley Quadrangle," January 6, 1984, file AA-011184/1, BLM records.

not lose its navigability status. This historic use is evidence as to its susceptibility and as this is still a roadless area, it could be used as a highway of commerce in the future if the need arose.¹⁰⁷

The navigability determination has not yet been incorporated into a legal decision to convey lands. The BLM has not yet completed adjudication of the selection applications of the Native Group and the State for lands in these townships.

Evidence of Commerce

We have found no solid evidence of use of Jim Lake for travel, trade, and commerce. In fact, the report on the Gordon canoe expedition in 1905 is the only known report of a boat being used on the lake. The available information suggests that people used trails on their journeys in this area between the Tanana and Kuskokwim basins. In the mid 1920's, when Upper Kuskokwim residents agitated for the establishment of a summer mail route on the portage route, Jim Lake was never mentioned as being a part of the route. They suggested the use of two packhorses to make weekly trips over the portage with a thousand pounds of mail.¹⁰⁸ In describing the portage, Kammersgaard, a trader on Lake Minchumina who was willing to use his boat to transport the mail up the Kantishna River system to Lake Minchumina, made no mention of Jim Lake. Instead, he indicated that the portage route consisted of a trail only. In describing the route he wrote: "Old portage trail, about eight and one-half miles; pretty bad trail; hits the lake [Lake Minchumina] in the southwest corner, but by cutting a new trail on a high, dry ridge, would be shorter and would come to the lake in the northwest corner. That trail would be about seven or seven and a half miles, and from portage landing to my cabin six miles. Good gravel beds along the lake [Minchumina] for walking."¹⁰⁹

Summary

Given the available limited information, it is not possible to reach a decision with certainty on the navigability of Jim Lake. Almost nothing is known about the lake's physical features—its depth, shoreline characteristics, and so on—that may shed light on its suitability for boat travel. What little is known about travel and transportation in the immediate area presents a confusing picture of the lake's usefulness for boat travel. On the one hand, two white explorers, nearly a century ago, relied upon an Indian's guidance and map to locate and cross the lake in a canoe on their journey across the historic Lake Minchumina Portage. Presumably, others crossed the Portage in the same manner, but we have found no new information of past or current boat traffic on Jim Lake. On the other hand, there is evidence that travelers on the Portage and local residents customarily used nearby trails for travel and transportation. When in the 1920's local residents identified the Lake Minchumina Portage as a possible summer route for the transportation of mail, they proposed to use packhorses to transport a thousand pounds of mail between Lake Minchumina and the North Fork Kuskokwim River. Jim Lake was not mentioned as part of the route.

Deep Creek¹¹⁰

Land Status and BLM Navigability Determinations

Deep Creek, a clearwater stream approximately 40 miles long, empties into the southwestern end of Lake Minchumina. The creek flows northerly through six townships: T. 12 S., R. 24 W., FM; Tps. 12-15 S., R. 25 W., FM, and T. 14 S., R. 56 W., FM. The mouth of the creek is located in Section 13, T. 12 S., R. 25 W., FM.

The State of Alaska and the United States are the principal riparian landowners. The riparian lands in all but two townships (T. 13 S., R. 25 W., FM, and T. 15 S., R. 25 W., FM) have been conveyed to the State of Alaska under AA-21236 (T. 14 S., R. 25 W., FM), AA-21237 (T. 14 S., R. 26 W., FM), AA-21231 (T. 13 S., R. 25 W., FM), and F-028722 (Tps. 12 S., Rs. 24 and 25 W., FM).

The United States continues to own land along two reaches of this creek. In T. 15 S., R. 25 W., FM, which encompasses the headwaters of the creek, the lands are managed by the National Park Service as part of the Denali National Preserve. In Sec. 2, T. 13 S., R. 25 W., FM, the lands are managed by the BLM and selected by a Native Group under AA-11184.

The State of Alaska owns the remainder of the lands along (and under) this creek. In 1963, under the Mental Health Act, the BLM granted tentative approval for the conveyance of lands in Tps. 12 S., Rs. 24 and 25 W., FM. The lowermost reaches of Deep Creek, including its mouth at Lake Minchumina, are located in these townships. The decision stated that navigable waters would be identified at the time of survey.¹¹¹ There is, however, no evidence in the casefile that supports a finding of navigability or nonnavigability. However, on the rectangular survey plats for these two townships, Lake Minchumina was meandered and the submerged lands segregated from uplands. Deep Creek is depicted as a single line on the plat; it was not meandered and the submerged lands segregated from the uplands. Nor was the submerged lands acreage excluded from the survey. All this suggests, as in Jim Lake, that BLM's intent was to convey the bed of the creek to the State and to charge the submerged land acreage against the State's acreage entitlement.

In the early 1980's, the BLM again reviewed the navigability of Deep Creek, this time its upper reaches and in support of conveyances under the Alaska Statehood Act. After considering the creek's physical character and the absence of any evidence of use, the agency determined that these reaches were not navigable. The determinations were then incorporated into decisions granting tentative approval for the conveyance of riparian lands in T. 14 S., Rs. 25 and 26 W., FM (AA-21236 and AA21237, respectively), and in T. 13 S., R. 25 W., FM (AA-21231), excepting Section 2.¹¹²

¹¹⁰ See USGS Skagway B-3 Quadrangle.

¹¹¹ Robert F. Hilton, Chief, Lands Section, Decision, September 11, 1963, file F-028722, BLM records.

¹¹² John P. Cook, "Navigability Determinations for the Tanana River Watershed," March 12, 1981; Sherman F. Berg to Chief, Division of Resources, June 12, 1981; Jules Tileston to State Director, June 19, 1981, and Elaine O. Wilde,

Subsequently, the BLM office re-examined the navigability of the lower reaches of Deep Creek, specifically, in Tps. 12 S., Rs. 24 and 25 W., FM, and in Sec. 2, T. 13 S., R. 25 W., FM. As noted above, in 1963 the BLM conveyed the lands underlying Deep Creek in Tps. 12 S., Rs. 24 and 25 W., FM, to the State of Alaska. Lands in Sec. 2, T. 13 S., R. 25 W., FM, are selected by Minchumina Natives Incorporated. In 1982, the BLM determined that these reaches were navigable. Local residents used boats on Deep Creek in order to tow logs suitable for building houses down the creek to Lake Minchumina. It was believed that these boats were capable of carrying a cargo in excess of a thousand pounds.¹¹³ These determinations have not yet been incorporated into legal decisions. In the case of surveyed townships Tps. 12 S., Rs. 24 and 25 W., FM, the BLM has not made any changes to the survey plats to adjust the acreages.

Evidence of Commerce

We have found no evidence of use of Deep Creek for travel, trade, and commerce. However, we have found sufficient evidence to support a finding that the lower reaches of the creek was or could have been susceptible to use as a highway of commerce at the time of statehood. Local residents boat the creek for recreational purposes (hunting and berry picking) and, most importantly, for logging purposes. The creek drains an area with good stands of timber for building cabins along Lake Minchumina. Local residents use the creek to transport logs to Lake Minchumina. One state government biologist described this use as follows: “Deep Creek is one of the few places within reasonable distance of Lake Minchumina where house logs area available. Over time, the utilized logging areas have extended further and further upstream from Lake Minchumina as timber has been opportunistically harvested. . . . Access is by 20 to 24 foot outboard riverboat.” On a map the biologist identified the then current logging areas as being in upstream of the reach selected by Minchumina Natives Incorporated (Sec. 2, T. 13 S., R. 25 W., FM).¹¹⁴

Deep Creek in T. 15 S., R. 25 W., FM, is not navigable. The headwaters of the creek are located in this township. We have found no evidence of boat use on this creek. After examining the USGS maps, we conclude that this reach of the creek is too steep and shallow for use by any type of boat. The lake at the creek’s head is inaccessible by water and land, and too small for use as a highway of commerce.

Summary

The State of Alaska owns lands underlying Deep Creek where it is the riparian landowner. This includes most of Deep Creek. The exceptions are that reach in Section 2, T. 13 S., R. 25 W., FM, and the headwaters in T. 15 S., R. 25 W., FM. In 1984 the BLM issued a draft memo with a

Decision, May 12, 1982, file AA-021231, and Willa May Shore, Decision, April 7, 1982, files AA-21236 and AA-21237.

¹¹³ BLM’s navigability determination and supporting evidence is found in C. M. Wheeler, “Mt. McKinley #1, FY83,” December 13, 1982, and Robert D. Arnold to Chief, Division of ANCSA and State Conveyances, December 28, 1982, file F-028722.

¹¹⁴ William E. Donaldson, Habitat Biologist, ADF&G, to Terry R. Hassett, March 23, 1984, file AA-011184/1. See also Draft Navigability Determination Memo for Minchumina Natives Incorporated, January 6, 1984, file AA011184/1.

proposed navigability determination for Deep Creek in Section 2, T. 13 S., R. 25 W., FM. The proposal was to determine this reach of the creek to be navigable. We have found no compelling evidence to overturn this determination.

Deep Creek in T. 15 S., R. 25 W., FM, is clearly not navigable. Based upon an analysis of the USGS maps, this reach is not suitable for use by any type of boat.

Interconnecting Sloughs

The State applied for all “interconnecting sloughs” of the rivers. However, the State did not provide any information relating to the physical character or historical use about any slough in specific or in general. Nor did the State identify the specific location of any slough. Without this information, it is not possible to determine whether or not a specific slough was navigable in fact, or susceptible to navigation, for travel, trade, and commerce at the time of statehood. Nevertheless, we do not believe that the navigability of any slough need be addressed. As a general rule, if the named rivers are navigable in fact, and if the waters of these rivers flow through the sloughs at the time of statehood, then the sloughs are an integral part of the navigable river and are thus navigable as well.

Conclusions

In assessing the navigability of inland water bodies, the BLM relies upon federal administrative and case law and the advice of the Interior Department’s Solicitor’s Office. The classic definition of navigable waters is found in *The Daniel Ball*, 77 U.S. (10 Wall.) 557 (1870). Pertinent DOI Office of the Solicitor’s opinions include Associate Solicitor Hugh Garner’s memo of March 16, 1976 (“Title to submerged lands for purposes of administering ANCSA”) and Regional Solicitor John Allen’s memo of February 25, 1980 (“Kandik, Nation Decision on Navigability”). The agency is also guided by the Submerged Lands Act of 1953 and the Alaska Submerged Lands Act of 1988.

After reviewing the State of Alaska’s application, riparian land status, and the historic record as set forth above, the history of federal land conveyances in the system, and the legal guidance, we conclude that the following water bodies (or reaches thereof) were navigable or not navigable for travel, trade, and commerce at the time of statehood. Under title navigability law, title to unreserved beds of navigable waters passed to the State of Alaska at the time of statehood. If not navigable, the submerged lands did not automatically transfer to the State. None of the water bodies was in a reserve or withdrawal at the time of statehood.

1. The Kantishna River from its mouth on the Tanana River to its head at the confluence of McKinley Fork and Birch Creek was in fact navigable at the time of statehood.
2. Birch Creek from its mouth at the head of Kantishna River to the mouth of Muddy River, and Muddy River from its mouth to and including Lake Minchumina, were in fact navigable at the time of statehood.
3. Deep Creek in Section 2, T. 13 S., R. 25 W., FM, was susceptible to use as a highway of commerce at the time of statehood. Deep Creek in T. 15 S., R. 25 W., FM, was in fact not navigable at the time of statehood.

At this time, we are unable to reach a decision on the navigability of Jim Lake. The available information is insufficient to make a decision. More information about the lake's physical features and its past and present use for travel and transportation is necessary.

Recommendations

1. The BLM should approve the State's applications for recordable disclaimers of interest in the beds of Kantishna River, Birch Creek (mouth at head of Kantishna River to mouth of Muddy River), Muddy River, Lake Minchumina and Deep Creek in Section 2, T. 13 S., R. 25 W., FM. Under title navigability law, title to the beds of these water bodies (or reaches thereof) passed to the State of Alaska at the time of statehood.
2. The BLM should reject the State's application for Jim Lake. The available information is not sufficient to render a navigability determination.
3. The BLM should deny the State's application for Deep Creek in T. 15 S., R. 25 W., FM. This lake and this reach of the creek are not navigable for travel, trade, and commerce.
4. The BLM should approve the State's application for the remainder of Deep Creek. The State of Alaska owns all of the riparian lands. The United States has no interest in the submerged lands where the State is the riparian landowner.
